

TEFLON ENCAPSULATED O-RINGS

APG Encapsulated O-rings consist of a seamless Teflon FEP or PFA outer sheath enclosing an elastomer core. The combination of the chemically resistant polymer encompassing either Silicone or Viton provides unique properties for a variety of demanding applications. Encapsulated O-rings will decrease downtime wherever corrosive fluids and gases cause premature seal failure. These O-rings have an operating temperature range of -60°C/-75°F to 260°C/500°F (PFA). Available in standard AS 568 sizes as small as -008. Also available are Teflon Encapsulated replacement gaskets for Cam & Groove couplings.

Major markets include:

- Tank Truck
- Semi-Conductor
- Pharmaceutical
- Chemical Processing
